

Information For the User
Febuxostat (40mg) Tablet

Febuglit 40 tablet

Composition:

Each film-coated tablet contains:

Febuxostat I.P. 40 mg
Excipients q.s.

Description:

Febuglit 40 Tablet contains Febuxostat, a non-purine selective xanthine oxidase inhibitor used in the management of chronic hyperuricemia in patients with gout. By lowering serum uric acid levels, it helps prevent gout flares, reduces tophi formation, and protects joints from long-term damage. Febuxostat provides a targeted approach with minimal effects on other enzymes involved in purine and pyrimidine metabolism.

Indications:

Management of chronic hyperuricemia in patients with gout
Prevention of recurrent gout attacks
Adjunctive therapy in urate nephropathy and uric acid crystal deposition disorders

Mechanism of Action:

Febuxostat inhibits xanthine oxidase, the enzyme responsible for the conversion of hypoxanthine and xanthine to uric acid. This leads to a reduction in serum uric acid levels and prevents monosodium urate crystal deposition in joints and tissues.

Dosage and Administration:

Adults: Usual recommended dose is 40 mg once daily, with or without food. Dose may be increased to 80 mg once daily after 2–4 weeks if serum uric acid levels are not adequately controlled, as directed by the physician.

Side Effects:

Headache, dizziness
Nausea, diarrhea
Joint pain during initial therapy (gout flare)
Liver enzyme elevations
Rare: Rash, hypersensitivity reactions, cardiovascular events

Precautions:

Monitor serum uric acid levels periodically during therapy
Initiation may precipitate acute gout attacks; prophylactic NSAIDs or colchicine may be recommended during the initial months
Use with caution in patients with severe hepatic or renal impairment
Not recommended for asymptomatic hyperuricemia
Use during pregnancy and lactation only if prescribed by the physician

Storage:

Store in a cool, dry place below 25°C. Protect from light and moisture. Keep out of reach of children.
