

Midotale 2.5 Tablet

Composition:

Each film-coated tablet contains:

Midodrine Hydrochloride I.P. equivalent to Midodrine 2.5 mg
Excipients q.s.

Description:

Midotale 2.5 Tablet contains Midodrine, an alpha-1 adrenergic agonist indicated for the treatment of symptomatic orthostatic hypotension. It acts by constricting venous and arterial blood vessels, thereby increasing vascular tone and elevating blood pressure. It helps reduce symptoms such as dizziness, lightheadedness, and syncope associated with postural drops in blood pressure.

Indications:

Symptomatic orthostatic hypotension
Neurogenic hypotension
Adjunctive therapy in autonomic dysfunction leading to low blood pressure

Mechanism of Action:

Midodrine is a prodrug that is converted to its active metabolite desglymidodrine, which selectively stimulates alpha-1 adrenergic receptors in the arteriolar and venous vasculature. This increases peripheral vascular resistance, thereby raising blood pressure without significant effect on heart rate.

Dosage and Administration:

Adults: Usual recommended starting dose is 2.5 mg two to three times daily during daytime hours. Last dose should be taken at least 4 hours before bedtime to avoid supine hypertension. Dose may be adjusted by the physician based on patient response and blood pressure monitoring.

Side Effects:

Piloerection (goosebumps)
Paresthesia, tingling sensation
Urinary retention
Supine hypertension
Headache, pruritus

Precautions:

Monitor blood pressure regularly, both sitting and supine
Use cautiously in patients with urinary outflow obstruction, severe organic heart disease, or thyrotoxicosis
Contraindicated in severe organic heart disease, acute renal disease, pheochromocytoma, and thyrotoxicosis
Avoid dosing close to bedtime to reduce risk of supine hypertension
Use during pregnancy and lactation only if clearly prescribed by the physician

Storage:

Store in a cool, dry place below 25°C. Protect from moisture and direct light. Keep out of reach of children.
