

Torslide Injection

Composition (per ml):

Torsemide 10 mg

Description:

Torslide Injection contains Torsemide, a potent loop diuretic used to manage fluid retention and edema. It acts on the ascending limb of the loop of Henle in the kidneys to inhibit sodium and chloride reabsorption, promoting diuresis and reducing excess fluid buildup. This injection form allows for rapid onset of action, suitable for patients requiring immediate diuretic effects.

Indications:

- Edema associated with congestive heart failure, renal disease, or hepatic cirrhosis
- Hypertension requiring diuretic therapy
- Acute pulmonary edema

Mechanism of Action:

Torsemide inhibits the $\text{Na}^+/\text{K}^+/\text{2Cl}^-$ co-transporter in the thick ascending limb of the loop of Henle, leading to increased excretion of sodium, chloride, and water. This results in decreased blood volume and reduced edema.

Dosage and Administration:

Administered intravenously or intramuscularly as prescribed by the physician. Dosage depends on the severity of the condition and patient response. Typically, doses range from 10 mg to 20 mg once daily.

Contraindications:

- Hypersensitivity to torsemide or sulfonamides
- Anuria
- Severe electrolyte imbalance

Precautions:

Monitor electrolyte levels, renal function, and blood pressure during therapy. Use cautiously in patients with diabetes, gout, or hepatic impairment. Avoid dehydration and overdiuresis.

Side Effects:

- Electrolyte disturbances (hypokalemia, hyponatremia)
- Hypotension
- Dizziness or headache
- Gastrointestinal disturbances

Storage:

Store below 30°C, protect from light. Keep out of reach of children.
